<u>APPLICATION NOTE 4639</u> - Use high-performance simultaneous-sampling ADCs for sensor signal conditioning in industrial multichannel data acquisition systems (DASs), (6 strán, 133 KB) By: Joseph Shtargot, Strategic Applications Engineer

Abstract: This application note will help the designer of high-performance multichannel data acquisition systems (DASs) to optimize

the interface between industrial sensors and a high-performance ADC. The example used is a power-grid monitoring system. The article explains how to select the proper components to achieve optimal system performance with the high-resolution MAX11046, MAX1320, MAX1308 multichannel ADCs. Schematics are shown.
